

Warehouse Stock Management

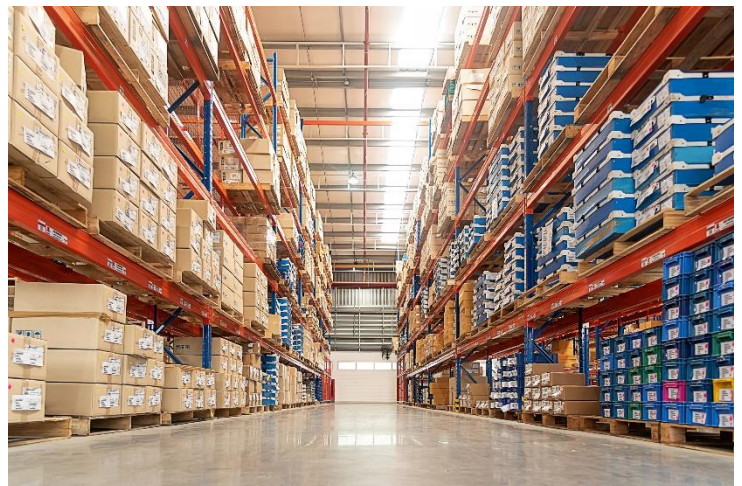

This module helps you make the most efficient use of your warehousing space and optimises your stock movements to ensure stock turnaround with fast and accurate stock picking.

The core stock control features of your NCompass system are extended with highly detailed tracking of stock movements within your warehousing. Our consultants create a detailed map of your available storage, typically using warehouse, aisle, bay and level locations, and load this into NCompass.

When stock arrives, NCompass will generate Store Requests for warehouse staff, locating those items in the most suitable locations. Similarly, pick lists are generated to prepare stock for dispatch, all sent to our portable scanners automatically. Because the location of each item is all handled automatically there is no requirement to group items by model, allowing you to use your storage more efficiently.

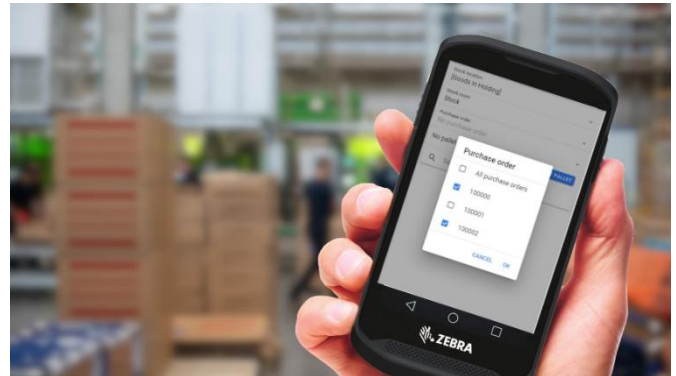

Key features

- NCompass tracks the exact location of every item of stock.
- Unlimited different classes/sizes of object to store
- Unlimited stock locations
- Optimised use of storage space
- Effective stock rotation
- Ensure you always load the correct items onto vans for dispatch.
- Implemented with advice and support from our experienced consultants.
- Rolling stock takes, even while business is actively trading.
- Optional link to carrier integration – generate pick lists, book consignments, print labels and send tracking details back to Amazon / eBay, then track parcels directly within NCompass.

Portable Scanners

- Allow you to view and update stock locations via our custom App.
- Purpose-built hardware for the task
- High-performance laser bar-code scanner to identify locations and stock items.
- One-touch store options allow additional location granularity.
- Receive stock movement tasks as they are generated.
- Send stock movement confirmations in real-time back to the main system.
- 3G/4G option available for locations without WiFi coverage
